Little Steps: Build Brief for Claude Code

Read this file and `little-steps-prototype.html` before writing any code. The prototype is a working single page app built inside Claude. It shows every screen, word and behavior the product should have. Your job is to turn it into a real, sellable product.

1. The product in one paragraph

Little Steps helps families care for a baby or toddler who came home from the NICU with ongoing medical needs. These children see many providers (primary care, GI, cardiology, ophthalmology, advanced feeding, physical, occupational and speech therapy, plus an in home nurse), and the information is scattered across texts, verbal handoffs, summary sheets and patient portals. Little Steps puts it all in one warm, hopeful place that the whole family and any willing helper can share. It must never feel like a hospital chart. Parents are often carrying trauma from the NICU, and the design exists to help them see progress and hope.

2. Who uses it

Role	Can do
Owner (usually a parent)	Everything, including inviting and removing people, billing and deleting the child's data
Family (other parent, grandparents)	View and add everything
Helper (nurse, therapist)	View the schedule and add notes, if the family invites them
Viewer	Read only

One account can belong to more than one family. Each family's data must be completely separate from every other family's.

3. Features to rebuild (all exist in the prototype)

Home

- Hero with the child's photo, name, age from birth date, and a "Up X since birth" badge from weigh ins.
- Daily encouragement card. Scripture (KJV, divine pronouns capitalized) or gentle non faith words, chosen per family in settings.
- This week: a seven day strip with colored dots per visit type, and a simple timeline for the selected day.
- The child's day so far as friendly tiles: meals, night feed, last meal, diapers, naps, playtime.
- After 5 PM, a gentle prompt if tonight's night feed is not logged.
- From his nurse: today's nurse note as a friendly card. "Keep an eye on" items appear in a soft highlighted box, never in alarm red.
- Practice together today: daily home exercises from therapists as a checklist, with who checked each item.
- What his helpers are saying: the latest visit notes per provider type.
- Bright spots: a one line "What was good today?" input that saves a win and plays a short confetti burst (skip it when the device prefers reduced motion).
- A moment for you: a daily self care prompt for the caregiver and a link to Hand to Hold (handtohold.org).
- One floating plus button opens an "Add a moment" menu. Nothing else on Home asks the user to enter data.

Visits

- Upcoming and past visits, filterable by provider type.
- Each visit holds: type, title, provider, date, time, location, who is going, what to bring, notes before the visit, what happened at the visit, and what to do at home.
- Weekly repeating visits. Build true recurrence (not copies). Two weeks before a series ends, ask whether to keep it going.
- Visit sheet: one tap builds a summary for the next provider with current medicines, weight trend, last seven days of intake, night feeds, nurse concerns, what other providers said, the home practice plan and open questions. Copyable as plain text. This feature uses no AI.

Diary

- Day by day view with the same tiles and a list of moments.
- Moment types: meal (bottle, tube bolus, tube pump, bottle then tube, breast), night feed (start, end, pump rate, total, formula, how it went; total calculates from rate and times), diaper, nap, playtime, medicine given, weigh in (pounds, ounces, length, head), nurse note, plain note.

Journey

- Growth chart comparing the child only to himself. No percentiles, no comparison to other children. This is a firm product rule.
- Each weigh in shows the gain since the last one.
- Wins worth celebrating, by category (a first, bright spot, feeding, growing, moving, sounds and talking, health, just because). Wins appear as stars along the growth chart.
- Daily intake and playtime bar charts for the last 14 days.

Helpers

- Team list with roles, phone numbers (copy button) and notes.
- Practice at home instructions grouped by provider, with active and stopped states.
- Medicines list with the Children's Healthcare of Atlanta dosing guidance line.
- Settings: child's name, birth date, photo, feeding unit (oz or ml), encouragement style.

4. AI capture (uses the Claude API)

Three ways information arrives, each with its own flow in the prototype (`openCapture` , `PROMPTS` , `applyCapture`):

1. **Nurse text**: paste the text or attach a screenshot. Extract date, time, nurse, total intake, meals, diapers, vitals, practice and play, and things to keep an eye on.
2. **Therapy handoff**: pick PT, OT or speech, then dictate what the therapist said at pickup. Extract what they worked on, home practice, therapist and next session. Attach it to today's session of that type.
3. **Doctor visit**: paste the After Visit Summary from MyChart or photograph the paper sheet. Extract type, provider, date, findings, home instructions, medicine changes and the next appointment, then offer to add that appointment.

Rules that must not change:

- The AI only drafts. A person always reviews and saves. Nothing is written without that step.
- Medicine changes from a visit go into the visit notes for a person to act on. AI never edits the medicine list or any dose.
- Call the Claude API from the server only. Never put an API key in the app.
- Send the minimum text needed, and do not keep raw photos longer than the extraction requires unless the family chooses to.

5. Design rules (trauma informed)

- The child comes first, medical details second. Open on his photo, name and day.
- Warm, gender neutral palette and rounded type. Copy the color tokens and fonts from the `:root` block in the prototype (Fredoka for headings, Atkinson Hyperlegible for body text). Support light and dark mode.
- No alarm red except on delete buttons. No dense data tables on Home.
- Warm words everywhere. Use "Meals" not intake, "Keep an eye on" not concerns, "his helpers" not providers, "Not yet" not "None logged", "Nurse visit" not shift.
- Calm empty states that reassure, for example "No visits today. A good day for cuddles and rest."
- Large tap targets for tired people at 2 AM. Works one handed on a phone.
- Accessible: real labels, visible focus, good contrast in both themes.

6. Privacy and security requirements

These are requirements, not suggestions. Have a healthcare attorney confirm which laws apply (for example HIPAA, state health privacy laws, and the FTC Health Breach Notification Rule) before launch, especially before selling to clinics or agencies.

- Strict separation of each family's data, enforced in the database (for example row level security), not only in app code.
- Encryption in transit and at rest. Photos stored privately and served through signed, expiring links.
- Sign in with email link or passkey. Invitations by email with a role.
- An audit trail of who added, changed or deleted each record.
- Family owner can export all data and delete the child's data permanently.
- Use vendors that will sign a Business Associate Agreement if the business model requires it.
- Never use real patient data in development or tests. Use invented sample families.

7. Recommended stack (Claude Code may propose better)

- Phase 1: a mobile friendly web app installable on phones (PWA). Next.js with TypeScript, Postgres through Supabase with row level security, Supabase Auth and Storage.
- Reminders: push notifications for upcoming visits and the night feed.
- Payments later: Stripe subscriptions.
- Phase 2: native iOS and Android apps once pilot families confirm what they use.

8. Replace the prototype's runtime

The prototype calls a Claude only runtime through `window.claude.use(...)`. Replace each part:

Prototype	Real app
`use("db")` collections: appts, logs, plan, meds, questions, team, wins, meta/profile, daily/{date}/done	Postgres tables, each with a `family_id`
`use("user")`	Your auth and family membership
`use("assets")` photo upload	Private storage bucket
`use("sample")` AI extraction	Server endpoint calling the Claude API

9. Build order

1. Data model, auth, families, invitations and roles, with row level security and tests proving one family cannot see another.
2. Visits with true recurrence, and the Home week view.
3. Diary moments and Home tiles.
4. Journey: growth chart and wins.
5. Helpers, practice at home, medicines, settings, photo.
6. Visit sheet.
7. AI capture flows with the review step.
8. Reminders and push notifications.
9. Pilot with five to ten families. Then Stripe subscriptions.

10. Done means

- A new family can sign up, add a child, invite a grandparent, and both see the same week within seconds.
- A nurse text pasted on a phone becomes a reviewed nurse note in under a minute.
- No screen on Home looks like a medical chart.
- Automated tests cover family data separation, recurrence, the night feed total calculation and the visit sheet.
